Vector Network Analyzer Calibration

Today any development, production, test or quality assurance department that works with RF signals on coaxial lines cannot function without latest measurement equipment. In high frequency technology vector network analyzers (VNA) are often used to determine the characteristics of RF and microwave devices.

The components of a VNA as well as the test assembly connected to the instrument have their own frequency and phase responses. This may cause false readings.

System errors can be adjusted by calibration of the VNA. During the calibration procedure, different calibration standards with defined and known electrical characteristics are connected to a VNA. These values and the measured values are compared to identify error coefficients. In a system error correction procedure the VNA adjusts the measured data of the DUT by the error coefficients. Thus the measurement accuracy increases.

The calibration of a VNA can be done in different ways depending on the required measurement accuracy. The calibration methods differ both in the number and form of the calibration standards used for the procedure.

The most commonly used calibration method is OSL (Open, Short, Load) for 1-port measurements and OSLT (Open, Short, Load, Through) for multiple port measurements.

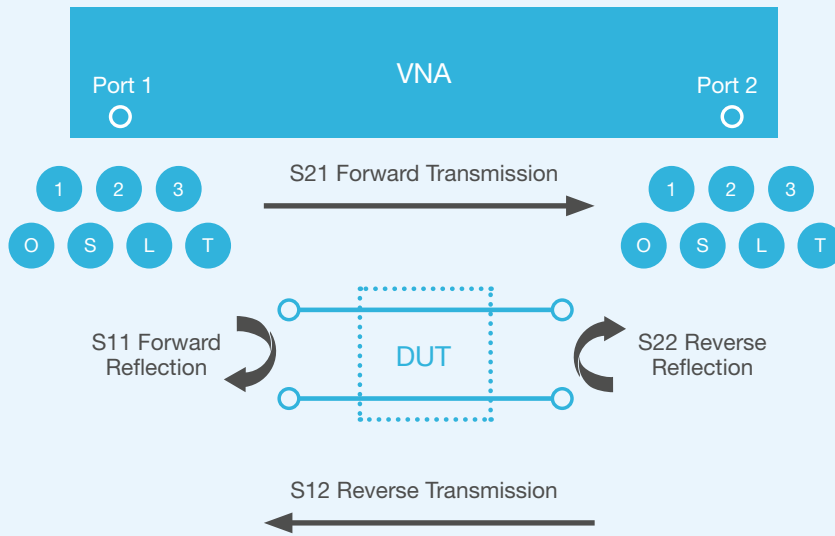

The names OSL and OSLT for the calibration methods can vary with other manufacturers.

For these two calibration methods SPINNER offers an appropriate selection of calibration equipment ranging from the high-precision calibration kit for laboratory use to the compact designed calibration combinations for field use.

Kits are available with 7-16, 4.3-10, N, 2.2-5, NEX10®, 3.5 mm, 2.92 mm, 2.4 mm, 1.85 and 1.35 mm. In manufacturing such components, SPINNER has reached a level of precision that sets new standards which many desire.

SPINNER also offers a broad line of coaxial measurement equipment with excellent electrical and mechanical performance for use in laboratory and production environments at frequencies up to 165 GHz.

Testing of 75 Ω Line Systems

Not only broadcasting systems, but also new communications applications use 75 ohm interfaces for high frequencies up to 18 or 20 GHz.

This has created a need for precise, reliable calibration and testing equipment that can be connected to 50-ohm vector network analyzers. SPINNER 75-ohm test adapters with type N connectors are now available in different versions to fill this gap.

SPINNER offers them in two forms: as a practical calibration kit with customized calibration coefficients and as a compact calibration tool with global coefficients. Both are characterized by outstanding accuracy and electrical specifications.

A typical application is testing of SDI 12G-compliant cables and interfaces, all of which have a resistance of 75 ohms. 12G supports a data rate of 12 Gbps. This SDI standard was developed to support greater resolution, frame rates, and color fidelity.

75-ohm systems can be measured with a 50-ohm vector network analyzer using a 75-ohm calibration kit and a proper unmatched mechanical adapter from 75-ohm to 50-ohm to avoid any damage on the inner conductor system.

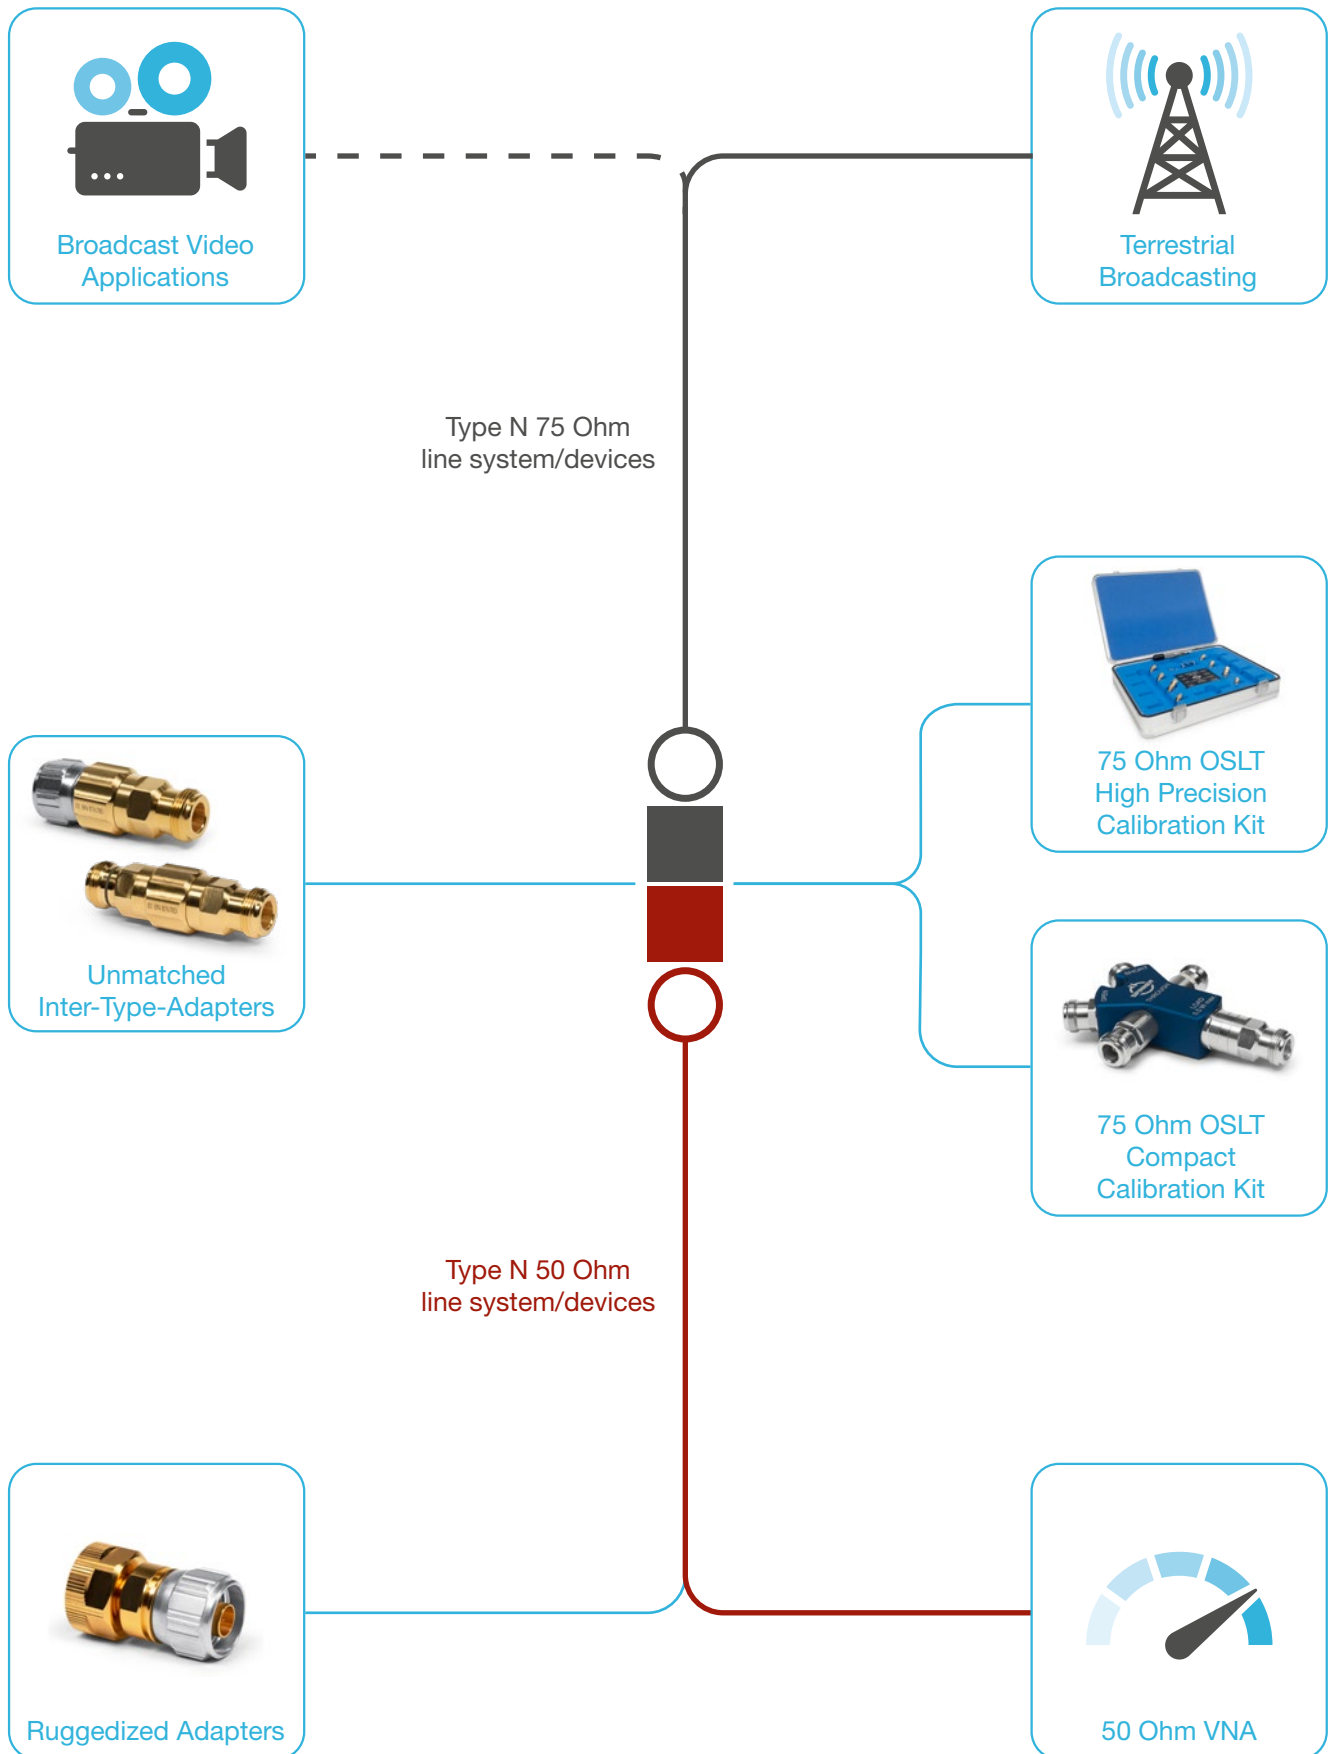

For frequencies up to 20 GHz, which need be measured on a 26.5 GHz VNA with a ruggedized 3.5 mm test port, SPINNER provides a unique adapter from N 75 Ohm to ruggedized 3.5 mm male and female.

Application Note

75 Ohm Testing Product Range

Minimizing PIM for over 25 Years

SPINNER understands how PIM performance can affect the growth of cellular networks and for decades has been devoting a huge R&D effort to offer a comprehensive portfolio of low-PIM products.

Passive intermodulation (PIM) is a form of intermodulation caused by the (generally very small) nonlinearities present in all passive components. When two or more frequencies are applied simultaneously, new and typically unwanted frequencies are generated.

If these frequencies are of sufficient power and fall into the frequency range of the receiving signal, they can significantly disturb the receivers of mobile base stations and negatively impact the quality of service. Symptoms include reduced bandwidth and even dropped calls.

Fixing the problem involves additional and often repeated investments for locating and replacing components with bad PIM behavior. At SPINNER we believe in avoiding these issues from the start.

We also set extraordinarily high standards with our definition of „low PIM“. Even most of our standard products such as connectors and jumpers feature a value of -160 dBc or better. Measuring the PIM properties of a component or system requires a measuring environment of sufficiently higher precision than the device under test.

Praxis

- Avoid all damage and contamination that may affect PIM values and make sure that all RF-relevant electrical connections used for PIM measurement are free of metal particles, dust, oxides and other contamination.

- All interseries adapters used for measurement should be designed as “PIM free” solutions with a single-piece inner conductor and a single-piece outer conductor.
- It is strongly recommended to use a dial gauge to ensure the right pin depths on each connector, otherwise there is a risk of damage and/or deformation.
- When a bad connection is discovered, sometimes the first reaction is to overtighten it. Instead, all coupling nuts and cable inputs should be tightened using a torque wrench that is adjusted. This will help minimize PIM.

Preparation of Test Equipment

The following requirements must be met to obtain comparable PIM measurements:

- PIM measurement must always be done by experienced and skilled staff, otherwise there is a risk that results will be misinterpreted
- Measurement equipment (frequency sources, spectrum analyzers and power meters) must be regularly calibrated based on the applicable national or international calibration standard.

Optimize Your Test Chamber Setup

Photo by: Jet Fabara

One of the problems that crop up when testing RF devices, machines, or vehicles in open-air environments is the large number of potentially interfering RF signals from radars, cellphones etc.

Mobile applications such as smartphones and tablets use high-speed connections, for example, to display or save steady high-resolution videos. The antennas that let these devices connect to a base station are increasingly broadband, which makes them more sensitive to electromagnetic interference.

The best way to test these devices is to place them in an isolated space called a low-reflection or anechoic chamber. Then intrinsic interference or interference radiation can be measured, coexistence tests can be carried out, or antenna characteristics can be verified.

RF test chambers are also used to measure radiated spurious emissions (RSEs) or antenna characteristics in an over-the-air (OTA) space.

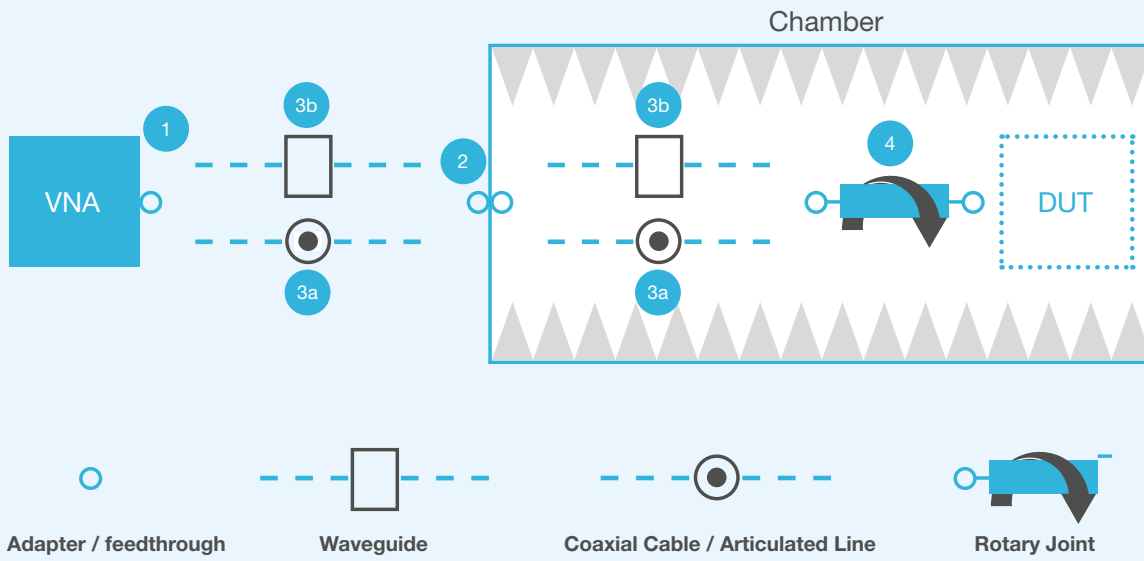

Equipment development is usually concluded with measurements for certification known as the “first-time pass”.

But what about RF signals when the test equipment is outside a chamber? How can signals be routed in and out without large losses and additional interference?

SPINNER offers a whole line of highly suitable components for optimizing signal transmission between the test equipment and the device being tested in an RF anechoic chamber.

They range from precision-manufactured test port adapters across special flexible test cables and flexible waveguides to panel feedthroughs and both single- and multi-channel coaxial and waveguide rotary joints for frequency ranges from DC to 210 GHz.

Precision Connectivity for Millimeter Wave

As the market for millimeter wave sensors for self-driving vehicles expands, the demand for proper RF connections in testing environments is also growing.

Reliable coaxial interface connections are crucial for achieving good RF performance, especially in E-band applications. A common frustration in RF laboratories is unwanted unlocking of the 1.00 mm coaxial thread after performing time-consuming calibrations. This spawned the idea of a 1.35 mm connector the “E Connector” with a precise metric thread like the 1.85 mm connector plus an integrated time saving push-pull capability.

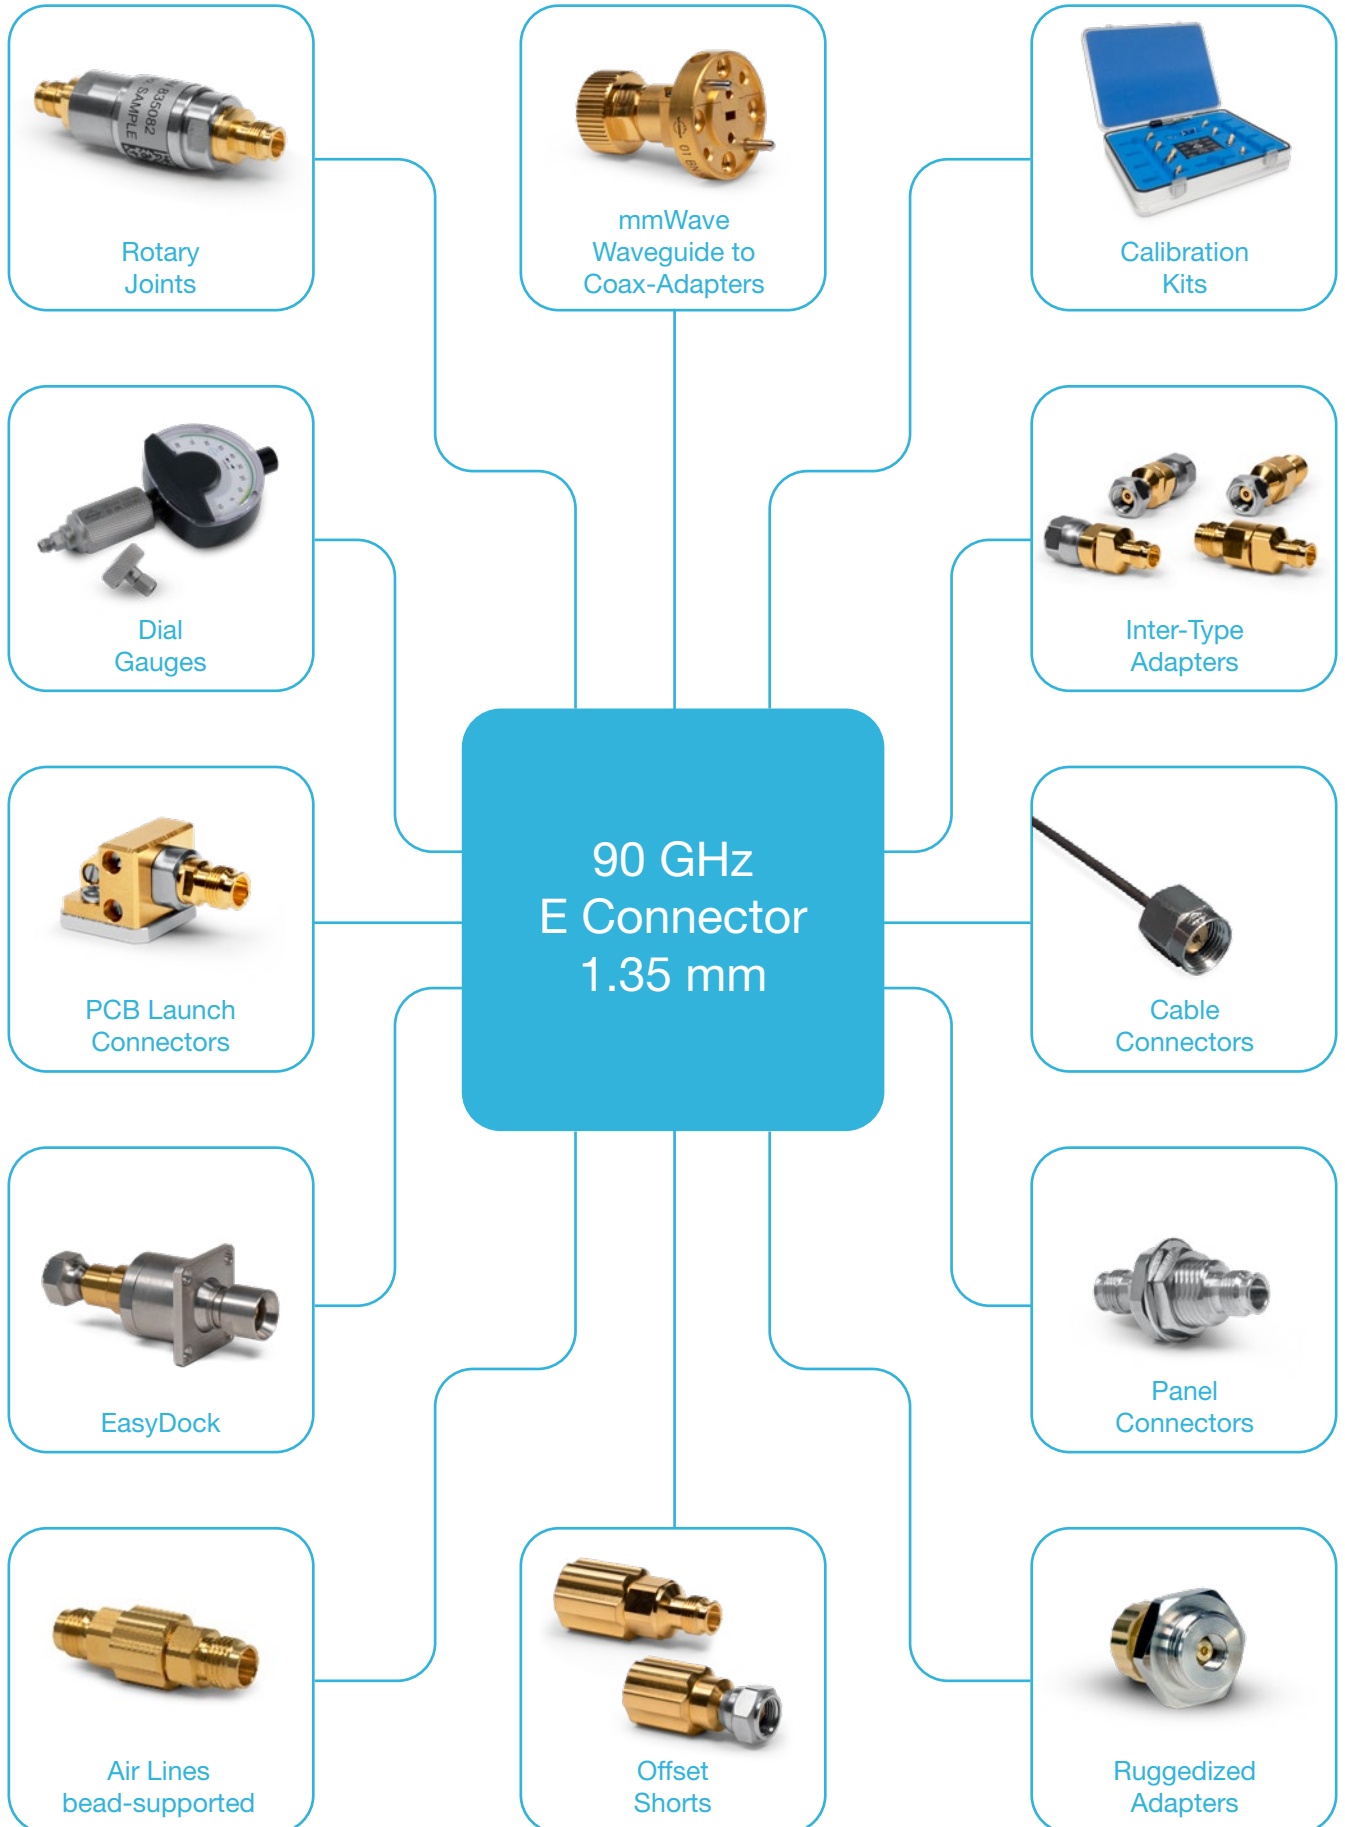

The E Connector is ideal for making high-performance RF measurements in the E-band without being held up by fragile 1.00 mm coaxial connector or wasting time reassembling WR 10 waveguides.

SPINNER designed the new 1.35 mm E Connector to close the gap between the 1.85 mm and the 1.00 mm coaxial connectors.

The 1.35 mm E Connector interface has been accepted for IEEE precision connector standard P287 and IEC 61169-65 now.

A manufacturer-independent supply of the new 1.35 mm E Connector is therefore ensured.

Creating a Suitable Environment

High Precision Calibration Kits

To ensure that a VNA delivers accurate amplitude and phase measurements without any drift, it is typically calibrated prior to each measurement. To do this, first the characteristic data of the various calibration standards are communicated to the VNA.

These characteristic data describe deviations from the ideal model. The calibration standards are then connected one after the other to the end of the test cable attached to the network analyzer.

The VNA then compares the measured values with the defined and known electrical properties of the calibration standard to calculate error terms. With their aid, all subsequently measured values are corrected to yield the actual values. If any change whatsoever is made to the test setup, no matter how small (slightly moving one of the test cables is enough), calibration is repeated before performing any additional measurements.

In fact, calibration is key for ensuring precise measurements. A VNA can be calibrated in various ways depending on the required degree of accuracy. The most frequently used calibration methods are OSL (open-short-load) for single-port measurements and OSLT (open-short-load-through) for two-port measurements.

Compact calibration kits (3-in-1 and 4-in-1)

The combination of all calibration standards in one handy unit is the optimum solution for simple and comfortable handling during the calibration of network analyzers with the methods OSL and OSLT. The excellent handling, ergonomic arrangement of the components, small size and low weight are appreciated by in-field users as well.

Our 4-in-1 calibration kits include open, short, load and through-line for the complete calibration of a network analyzer with two or more ports with the OSLT method.

Our 3-in-1 calibration kits include all necessary standards for a complete OSL calibration of single port network analyzers, used for field testing of wireless network installations.

High-precision calibration kits up to the cut-off frequencies of the connector series

In order to achieve the best possible measurement results over the whole frequency range of a connector series the VNA is calibrated with one of several high-precision SPINNER calibration kits.

The calibration comparison standards open circuit (Open), short circuit (Short) and fixed load (Load), each as a plug or socket, are included in our OSL calibration kits.

Additionally, our OSLT calibration kits include through adapters (Through), one with plug-to-plug and one with socket-to-socket connections. Optionally, a plug-to-socket adapter is available. All necessary data for the calibration are included.

Calibration Kits, OSL, Compact 3-in-1, 50 Ω

- The all-in-one compact calibration kit for one port calibration
- Open, short and load (OSL) in one compact handy device
- Applicable to all VNA
- For frequencies from DC to 6 GHz

Other interfaces on request.

LRL Calibration Kit

- High-end S-parameter measurements
- Very accurate for phase measurements
- Very good effective directivity and testport-match => uncertainty is smaller compared to OSLT- (TOSM-) calibration
- Center- and outer conductor are matched in their lengths to avoid gaps during calibration

Part number	Interface	Frequency Range	Insertion Loss
BN 533319	4.3-10 male-female	DC to 12 GHz	44 dB
Set components	Model	Interface	Nominal electrical length*

Adapters

Whenever the connector system of the VNA and the object to be measured do not match, special transitions, so called adapters, are required.

Adapters are used to connect line elements of different connection sizes (so-called inter-type or between-line adapters) or within one size but of different connection genders (so-called within-type or in-line adapters). The term transition connector is also used as another common term for adapters.

For example, the object to be measured has connections of type 4.3-10 plug and all measuring ports have the connector system 3.5 mm plug.

As a result, the available maximum frequency of the test ports is usually limited by the use of a different connector system. For example, when using a 4.3-10 connector system on a VNA with a 3.5 mm connector system, the frequency is limited to 12 GHz instead of 26.5 GHz.

Some connector systems do not require an adapter, as they are at least mechanically compatible with each other: 3.5 mm with SMA, 2.92 mm and vice versa, 2.4 mm with 1.85 mm and vice versa.

Push Pull Adapters

SPINNER push-pull adapters provide excellent mechanical stability and a fast and accurate method for continuous connects and disconnects without the time-consuming tightening of the connector with a torque wrench.

The adapter is quickly and easily mated and de-mated by pulling its coupling nut backwards, pushing it onto the corresponding connector and loosening the nut.

Our technology is compatible with any standard socket in the corresponding connector series. The use of high-quality materials ensure the adapter's ability to produce precise connections and maximize its lifetime.

Precision Inter-Type Adapters, 50 Ω

Push-Pull Adapters

- Quick connector for port or connector saving tasks
- Lowest intermodulation
- Lockable
- Unlockable in jig via automated handling
- Quick & reliable connection
- Extremely compact
- Guaranteed matings

Part Number	BN 432051
Coaxial DUT port interface connector	4.3-10 male push-pull
Coaxial outgoing (Analyzer) port interface connector	4.3-10 female
Frequency range	DC to 2.7 GHz
VSWR, max.	Max. 1.08 @ DC to 2.7 GHz
Passive intermodulation (IM3) @ 2 x 20 W	Max. ≤ -165 dBc; typ. ≤ -168 dBc
Insertion loss	Max. 0.05 dB
Isolation	90 dBc
Matings	Min. 500 ¹⁾
Weight	190 g

1) For optimal measurement results, cleaning must be regularly performed and assessed by expert staff.

Push-Pull Adapters

Part Number	Interface Type	Frequency Range	Return Loss, min.
BN 194472	7-16 male push-pull – Type N female	DC - 7.5 GHz	40 dB @ DC to 2 GHz 30 dB @ 2 to 7.5 GHz

Part Number	Interface Type	Frequency Range	Return Loss, min.
BN 950870*	Type N male push-pull – female	DC - 18 GHz	40 dB @ DC to 2 GHz 34 dB @ 2 to 10 GHz 30 dB @ 10 to 18 GHz

Part Number	Interface Type	Frequency Range	Return Loss, min.
BN 640570*	3.5 mm male push-pull – female	DC to 26.5 GHz	40 dB @ DC to 6 GHz 30 dB @ 6 to 12 GHz 25 dB @ 12 to 26.5 GHz

*The pressure-ring (green rubber) in the connector head included is a wearing part and should be replaced after approx. 5,000 mating cycles

Accessories for Push-Pull Adapters

A09431	Pressure-Ring (green rubber) for BN 950870
A09636	Pressure-Ring (green rubber) for BN 640570

SPINNER EasyDock – 1.35 mm Blind Mate Adapters

- For jig operated test applications in production lines
- Unique smallest floating E-band connector DC-90 GHz
- Outstanding number of matings
- Design allows smallest cluster in multipole applications

Part Number	BN 535301	BN 535302	
Coaxial DUT port interface connector	1.35 mm male blind mate		
Coaxial outgoing (analyzer) port interface connector	1.35 mm male	1.35 mm female	
Version	Blind mate/push-pull non-locking, four-hole flange		
Frequency range	DC to 90 GHz		
Return loss, min.	25 dB @ DC - 26.5 GHz 20 dB @ 26.5 - 70 GHz 15 dB @ 70 - 90 GHz		
Maximum allowable misalignment corrections			
Transversal			± 0.5 mm
Axial			2.5 mm 1 mm
Angular			± 0.5°
Matings	10.000		

SPINNER EasyDock – Push-Pull Adapters

- For jig automated coupling movements to multiple DUT ports
- Self-aligning
- Non-locking
- Guaranteed matings

Adapters

Part Number	BN 293809	BN 293810	BN 194476	BN 432014
Coaxial DUT port interface connector	7-16 male push-pull	7-16 male push-pull	7-16 male push-pull	4.3-10 male push-pull
Coaxial outgoing (analyzer) port interface connector	7-16 female	7-16 female	4.3-10 female	4.3-10 female
Mounting	Bulkhead ¹⁾			
Frequency range	DC to 6 GHz			
VSWR	Max. 1.02 @ DC to 2 GHz Max. 1.06 @ 2 to 6 GHz			
Passive intermodulation (IM3) @ 2 x 20 W	Max. ≤ -162 dBc (for first 5,000 matings)			
Insertion loss	Max. 0.05 dB			
Maximum allowable misalignment corrections				
Transverse	±2 mm			
Axial	6 mm			
Angular (at minimum stroke of 1.5 mm)	±1.5°			
Contact force during measurement	≈ 80 N			
Matings	Min. 5,000 at PIM / min. 10,000 at VSWR			
Special feature			Supports enhanced screening effectiveness	

1) Please refer to data sheet for other mounting options.

SPINNER EasyDock – Self-Locking Adapters

- For robotic based coupling movements to DUT
- Pick & connect suitable for 2-jaw gripper
- Self-aligning
- Lockable
- Enables top productivity in large-volume production
- Quick & reliable connection
- Guaranteed matings

Part Number	BN 293820	BN 194482C0002	BN 432047C0002	
Coaxial DUT port interface connector	7-16 male push-pull, lockable		4.3-10 male push-pull, lockable	
Coaxial outgoing (analyzer) port interface connector	7-16 female	4.3-10 female		
Operation	2-jaw gripper, e.g. handled by robot			
Frequency range	DC to 6 GHz			
VSWR	Max. 1.02 @ DC to 2 GHz Max. 1.06 @ 2 to 6 GHz			
Passive intermodulation (IM3) @ 2 x 20 W	Max. ≤ -163 dBc (for first 5,000 matings)			
Insertion loss	Max. 0.05 dB			
Maximum allowable misalignment corrections				
Transverse				±1.5 mm
Axial				6 mm
Angular (at minimum stroke of 1.5 mm)	±1.5°			
Contact force	≈ 80 N			
Matings	Min. 5,000 at PIM / min. 10,000 at VSWR			
Weight	510 g	450 g	420 g	

Port Savers

- Protects damageable PIM test equipment
- For sensitive testing and measurement applications
- Abrasion-proof
- Tarnishing and corrosion proof
- Nickel-free
- vRoHS-compliant

Part Number		BN 756404	BN 432017

Panel Connectors and Cables

RF panel mount and cable connectors are found in a wide range of applications such as communication infrastructure, medical, research, industrial, aerospace and defence, automotive and consumer products, and must operate reliably even under the most difficult conditions.

No matter where the application is, SPINNER guarantees the best transmission characteristics, enables high bandwidths and signal integrity and offers a robust design.

RF cable connectors from SPINNER are provided in standard or custom configurations with cable entries and soldering sleeves for the most common 50 Ohm RF cable types.

Connectors for RF cables are available for: 1.00 mm, 1.35 mm, 1.85 mm, 2.4 mm, 2.92 mm, 3.5 mm, 1.5-3.5 in male or female straight, male push-pull as well as a bulkhead, D-hole or 4-hole panel mount version.

Thru-male

For instrument wiring, we offer precision-manufactured cable connectors with the lowest insertion loss. The inner cable conductor is also the inner connector conductor. There is no need for time-consuming soldering to the connector ferrule.

As the connections in the devices are only contacted once, the wear of the cable inner connector pin is negligible.

Sometimes it is also necessary for space reasons to connect a cable for higher frequencies to a cable connector for a low frequency. These cables are thinner and easier to bend and thus allow installation in the tightest of spaces. The somewhat higher attenuation values are neglected in this case.

SPINNER cable connectors are all especially suitable for use with semi-rigid cables. 3.5 mm is intermatable with 2.92 mm (K) connectors, the 2.4 mm with the 1.85 mm connectors.

With the 1.35 mm E-connector standard, a coaxial connector system is on the market that enables applications up to 90 GHz. The E-connector offers a more reliable mechanical locking than the 1.0 mm coaxial connector system and is perfect suited for many test applications in the field of automotive radar.

Coaxial Panel Connectors

Part Number	Interface Type A	Interface Type B	Frequency Range	Return Loss, min.
BN 533168	2.92 mm female, bulkhead	2.92 mm female	DC - 44 GHz	27 dB @ DC to 10 GHz 24 dB @ 10 to 26.5 GHz 20 dB @ 26.5 to 44 GHz

Part Number	Interface Type A	Interface Type B	Frequency Range	Return Loss, min.

Examples of sales article numbers:

JS38-7M7F-2M-I3: SF 3/8" jumper with 7-16 male and 7-16 female; length 2.0 meter; low PIM performance with ≤ -165 dBc; test protocol per order.

JS12-7M43RS-1M3-I5: SF 1/2" jumper with 7-16 male and 4.3-10 female right angle screw; length 1.3 meter; low PIM performance with ≤ -170 dBc; test protocol per jumper.

Coaxial Articulated Lines

Articulated lines boast excellent RF properties and an extremely long service life. They are considerably more robust than ordinary test cables, lasting several times as long.

Features

- Extremely long life
 - 1 Million flex cycles guaranteed for articulated line (The rotary joints allow movements without stressing of the material by strain or torsion)
 - Worn-out port saver connectors (5000 matings guaranteed) can be easily replaced by customer
- Excellent amplitude and phase stability
 - Also during movement
 - Also with temperature drift
- Accurate and reproducible RF measurements
 - No need for adapters because 3.5 and N connectors are available as male and female
 - VNA calibration is not affected by movements
- Highly flexible
 - DUT ports in any orientation can be connected within a sphere 1 m in diameter (0.5 m for short line)
 - Rotation allowed
 - No mechanical stress introduced to DUT
- Ecofriendly
 - Long life
 - Repair-friendly
 - Recyclable

Applications

- General test bench use
- Network analysis (S-parameter measurement)
- Robotic test setups
- Measurement of rotatable DUTs (e.g. rotary joints and rotating systems)

SPINNER EasySnake – The Flexible Terahertz Waveguide Assembly

SPINNER EasySnake for E- and W-band performs the function of a **hollow metallic** waveguide but offers two degrees of freedom: flexible bending and twisting **in any direction** while delivering excellent measurement results at the same time. Even conventional flexible waveguides made of electrically conductive bellows are typically non-twistable i.e. resist torsion, which significantly limits the feasible test configurations.

They are also completely intolerant of minimally misalign or twisted flanges. The SPINNER EasySnake overcomes this by combining the flexibility of a conventional RF measurement cable with the excellent low-loss transmission characteristics of a conventional non-flexible waveguide system.

Features

- Dielectric waveguide supported by unique tubular segments (patent pending)
- Flexible, i.e. bendable and twistable (eliminates installations problems caused by misalignment of flanges)
- Flex-stable, i.e. keeps chosen bending geometry
- Built-in transitions from dielectric to rectangular waveguide
- Insertion loss outperforms any coaxial cable and single-mode metallic waveguide
- Excellent amplitude stability with flexure and temperature change
- Length configurable in steps of 25 mm
- Mechanically protected and electrically shielded
- High-voltage decoupled waveguide transitions

Applications

- General test bench use
- Network analysis (S-parameter measurement)
- Antenna testing (near field, far field)
- Environmental chamber and vibration testing

SPINNER EasyLaunch – Solderless PCB Connectivity

The Challenge

There is an increasing demand for millimeter wave signal pickup on printed circuit boards (PCBs). However, existing solutions either limit the range of possible PCB layouts or reduce RF performance.

In most cases, layout designs are limited by the need to solder PCB adapters to the edge of the board. The worst case is when the board includes cavities for picking up RF signals somewhere in the middle.

Other solutions that involve taping RF signals in the middle of the board impair RF performance since the PCB Adapter's still inner conductor pricks the surface.

Conventional Solution

The Benefits

- Excellent RF performance:
The soft-launch concept avoids compromising the PCB surface, even when there are multiple launches.
- Support for more compact PCB designs:
The SPINNER EasyLaunch Adapter can be positioned anywhere.

The Solution

The flexible, soft-launch SPINNER EasyLaunch is mounted flush with the PCB surface and ensures excellent RF performance, even with multiple launches.

This technology permits **variable positioning** of the connectors and **maximizes flexibility** for placing RF contact.

Advantages of SPINNER EasyLaunch

- Variable positioning for maximum flexibility
- Excellent RF performance for the highest frequencies
- Compact board design

SPINNER EasyLaunch Solution

SPINNER PCB Adapters can be positioned anywhere

- The SPINNER EasyLaunch Adapter and PCB board can be easily reused—no soldering required.
- Flush contact with the PCB
- Support for a wide range of PCB substrates
- The fixed connector interface can be ordered for any angle between 0° and 90°.

RF Rotary Joints for Measurement Tasks

SPINNER rotary joints excel with compact designs, excellent VSWR, low insertion losses, minimal fluctuation of transmission characteristics while rotating, and high crosstalk attenuation between individual channels across the entire range of frequencies used.

Noncontacting Rotary Joints

Noncontacting RF rotary joints (RJ) are available in **coaxial and waveguide designs for frequency ranges up to 100 GHz**. They are characterized by an especially long service life. Signal transmission is possible at a bandwidth of about 20% of the highest transmitted frequency.

Noncontacting rotary joints are used for **narrow-band transmission**. With special coupling structures, the same module can also be used to transmit two different frequency bands (e.g. the X and L bands).

Contacting Rotary Joints

In contacting rotary joints, the inner and outer conductors of the stator and rotor are DC-coupled. The maximum frequency depends on the diameter of the coaxial line. These coaxial rotary joints are used for **broadband applications**, allowing signal transmission in the frequency range from DC up to 120 GHz.

Interface Styles

The interfaces are available in I, U and L styles. These differ in the orientation of the input and output connections of a rotary joint (at the rotor and stator).

In the I style, both are aligned with the rotational axis, in the U style both are perpendicular to the rotational axis, and in the L style one is perpendicular to the axis while the other is aligned with it.

Application note:
[Rotary Joints – Installations Guidelines](#)

Low PIM Single-Channel Coaxial Rotary Joints

- No torsion on test cables
- Lowest intermodulation
- Contactless
- Guaranteed service life
- Enables top productivity in large-volume production
- Quick & reliable connection
- Guaranteed matings

Switches

Automate mobile radio antenna testing with SPINNER low-PIM switches for up to 6 GHz!

A surprisingly large share of low-PIM RF component testing is still done manually. But there is enormous potential for reducing both labor and costs.

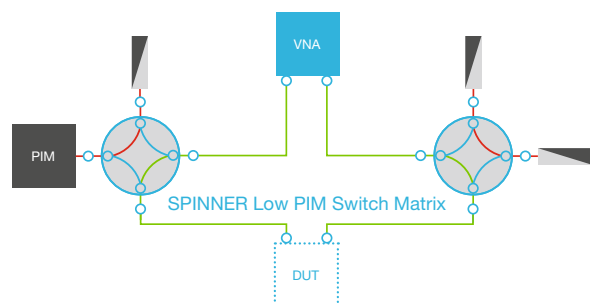

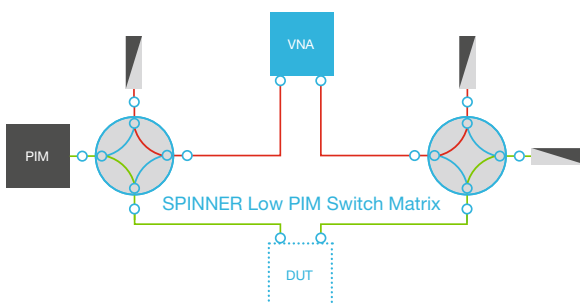

Although very similar approaches are taken for testing many products, many companies still aren't fully tapping the available possibilities for streamlining them. For example, almost all manufacturers still use mobile radio antennas and radio units to measure VSWR and PIM. The methods they work with are quite similar, but practically without exception they involve laboriously inserting individual devices and cables between the objects being tested and the measurement equipment.

The newly developed SPINNER low-PIM switch has great potential for boosting the efficiency of testing. Technically it's a double-pole, double-through (DPDT) crossover switch, also known as a switching matrix, with two inputs that are switched through to two outputs. It's excellently suited for measuring VSWR and PIM, since it eliminates the need to

laboriously disconnect and reconnect the test setup for each object. Plus, if multiple adapters and lines have been used they can either be eliminated completely or deployed more efficiently elsewhere. After each measurement, it's only necessary to throw the switch to continue testing with different settings or devices. And if multiple tests need to be performed at the same time, a switching matrix can be assembled to operate several switches at once, depending on the required test path, and perform multiple measurements simultaneously.

These extremely low-PIM switches feature a service life of about 500,000 cycles and are specified for -165 dBc (typ. -170 dBc). They are available with 7-16 or 4.3-10 connectors for frequencies up to 3.8 GHz. We're now also offering a new version with 4.3-10 connectors for up to 6 GHz.

Tests have shown that costs can be slashed by up to 80% by using switches and switching matrices, depending on how they're configured.

Coaxial 2-Way Switches up to 3.8 GHz

- Lowest intermodulation
- Maximum phase and amplitude stability
- Fast switching
- Hot switching
- Guaranteed cycles
- Cascadable
- Suitable for calibrated setup

 RF Test: Switching between VSWR and PIM using
 SPINNER's low PIM switch/EasyDock

Coaxial 2-Way Switch up to 6 GHz

- Lowest intermodulation
- Highest phase and amplitude stability
- Fast switching
- Hot switching
- Guaranteed cycles
- Cascadable
- Suitable for calibrated setup

Part Number	BN 754100 4.3-10 female		
Frequency range	0.617 to 2.69 GHz	3.4 to 4.2 GHz	5.15 to 5.925 GHz
Return loss	Min. 20 dB	Min. 20 dB	Min. 18 dB
Isolation	Min. 55 dB	Min. 35 dB	Min. 35 dB
Insertion loss	Max. 0.1 dB	Max. 0.1 dB	Max. 0.2 dB
Average power capability	300 W		
Peak voltage	1 kV		
Passive intermodulation (IM3) @ 2 x 20 W	Max. ≤-165 dBc; typ. ≤-168 dBc		
Switching time	100 ms		
Switching frequency	Max. 30 operations per minute		
Service life	Min. 500,000 cycles		
Dimensions (L x W x H)	128.8 mm x 128.8 mm x 116.34 mm		
Weight	≈ 1.75 kg		

Switching Matrix – Low IM, 8 In / 8 Out up to 3.8 GHz

Figure similar

- Contactless switching
- Lowest intermodulation
- Maximum phase and amplitude stability
- Fast switching
- Hot switching
- Guaranteed cycles
- Cascadable

Part Number	On request		
Interface type (16 connections)	4.3-10-f (50 Ω) per IEC 61169-54		
Characteristic impedance	50 Ω		
Frequency range	0.69 to 0.96 GHz	0.96 to 2.69 GHz	3.4 to 3.8 GHz
Return loss	Min. 13 dB	Min. 18 dB	Min. 16 dB
Return loss repeatability	Min. 40 dB		
Isolation	Min. 55 dB		
Insertion loss	Max. 0.7 dB	Max. 0.7 dB	Max. 0.9 dB
Passive intermodulation (IM3) @ 2 x 20 W	Max. ≤-155 dBc; typ. ≤-165 dBc		
Switching time	100 ms		
Switching frequency	Max. 30 operations per minute		
Life	Min. 500,000 cycles		
Dimensions (L x W x H)	666 mm x 482.6 mm x 443.7 mm		
Weight	≈ 40 kg		
Control interface	Controlled via USB Ethernet Other protocols on request

Dial Gauges

- Designed to properly gage the contact pin locations and pin depth of used Interfaces
- Marked tolerance limits for different connector grades
- Calibration standard to adjust to zero

Why use a gauge?

Proven RF measurement procedures require that all coaxial connectors on equipment, cables and terminations be routinely measured to detect mechanical tolerance variations that could affect electrical performance or damage the connector. When using coaxial cables, it is particularly important for them to be tested before use to ensure that the assembled connector conforms to the relevant mechanical specification limits. There is otherwise a risk of damage to the calibration components, which would in turn result in costly downtimes and repairs. Coaxial connectors should never be forced together when making a connection, since the apparent need to do so often indicates that they are defective, damaged, or incompatible.

Certain dimensions are critical for the mechanical integrity, non-destructive mating and electrical performance of the connector. The mating face is usually offset from the reference plane. This is done to reduce mechanical damage or misalignment when making connections.

On a SPINNER dial gauge, the tolerance limits for the various connector standards are color-coded on the dial. This makes a good/bad assessment of the gauge dimensions of precision connectors easy even without in-depth knowledge of the standard. A so-called reference gauge for monitoring and calibrating the dial gauge is included in the scope of delivery.

Part Number	Interface type	Gauge range	Scale marking	Measurement accuracy
BN 537015	7-16 male	5 mm	0.01 mm	0.005 mm
BN 537037	7-16 female

BN 534940	1.35 mm male			
BN 534941	1.35 mm female			

Torque Wrenches

Properly tightening connectors improves every calibration and subsequent measurement.

- Preset with the precise torque needed for 1.35 mm, 1.85 mm, 2.4 mm, 2.92 mm, 3.5 mm and Type N Interfaces
- 8 mm version with soft pads on spanner flats avoiding scratches on precision connector surfaces
- Additional open-ended wrench included in set BN 238741

Why use a torque wrench?

RF torque wrenches are designed to help prevent excessive tightening of the coupling nut of the sensitive coaxial precision connectors. The international standards specify a maximum tightening torque for each precision connector size, which must not be exceeded. These torque values differ considerably from those of the standard connectors. The user must therefore ensure that the correct torque value is applied to the connector.

SPINNER torque wrenches for precision connectors are therefore already preset to the correct torque. However, this alone is not enough for torque-controlled screwing with high accuracy. Even when using a torque wrench, both sides of the connector can be damaged if,

for example, the connector covered by the coupling nut rotates unintentionally. To prevent this, the connector should be additionally held in its initial position with a simple open-ended wrench.

When the set torque value is reached, this is indicated by a clearly audible clicking of the torque wrench. From this point on, no further force should be applied. It is also not necessary to repeat the tightening process. Torque wrenches for precision applications should be checked or calibrated regularly. An interval of 12 months is recommended. This service can be requested from our aftersales service center.

HIGH FREQUENCY PERFORMANCE WORLDWIDE

SPINNER designs and builds cutting-edge radio frequency systems, setting performance and longevity standards for others to follow. The company's track record of innovation dates back to 1946, and many of today's mainstream products are rooted in SPINNER inventions.

Industry leaders continue to count on SPINNER's engineering excellence to drive down their costs of service and ownership with premium-quality, off-the-shelf products and custom solutions. Headquartered in Munich, Germany, the global frontrunner in RF components remains the first choice in simple-yet-smart RF solutions.
